Adaptive AI Sales and Negotiation Agent

Problem Statement

Build a real-time voice AI sales agent that runs a complete customer qualification and sales conversation without relying on a fixed script.

Must handle:

- *Natural turn-taking & interruptions*
- *Objections on pricing, trust, and product fit*
- *Memory of details shared earlier in the call*
- *Live retrieval of product, pricing & availability info*
- *CRM / calendar / lead-management integration*
- *Human escalation with full conversation context*

Problem Description:

Every missed sales call is lost revenue. Scripted bots can't handle real customers, they stumble on interruptions, changing needs, or tough objections, so leads go cold. Sales teams can't be everywhere at once. A voice AI that listens, remembers, and adapts like a real rep could turn every inquiry into a qualified opportunity.

Echo Sphere

Proposed Solution / Idea Overview:

- *We're building a voice AI sales agent that doesn't follow a script, it reasons through each conversation live.*
- *Most voice bots run on branching trees. Customer says something unexpected, the bot loops or stalls.*
- *Ours maintains a live conversation state, tracking requirements, objections, qualification score, and deal phase and the LLM reasons against that state every turn.*

Voice AI Sales Agent – System Architecture

6-Layer Pipeline Built on Agora Conversational AI Engine

- Agora's Conversational AI Engine** already handles the hardest part — real-time audio transport, VAD, and turn detection — as a managed service with official SDKs and sample repos

- STT (Deepgram), LLM (Claude/GPT-4o), and TTS (ElevenLabs/Cartesia)** are all mature APIs with sub-second latency, used in production by dozens of voice AI companies today

- CRM and calendar integrations** (HubSpot, Google Calendar) have well-documented REST APIs and existing Zapier-style connectors — no custom infrastructure needed

Voice AI Sales Agent

Smarter conversations. More deals closed.

- *It also negotiates, escalating from discounts to pilots to human handoff, instead of just quoting a price.*
- *Books meetings on the call, writes to the CRM in real-time, and passes full context on escalation.*
- *Built on Agora's real-time voice layer for sub-second latency and natural turn-taking.*

Submission Instructions:

- Submit your document in PDF format named as:
[TeamName_EchoSphere2026_IdeaSubmission.pdf](#)
- Upload it on the commudle Submission Portal.
- Deadline: **28th August, 2026 23:59**
- Keep your Idea Overview concise to 10-12 pages, focus on clarity, originality, and feasibility.
- Please remove the Italic sentences from the document once your document is ready to submit.
